Date: May 2026

Project: Capstone Web Application – Module 1 Technical Documentation

Introduction

This document provides a detailed summary of the work completed during Module 1 of the Capstone Web Application project. The purpose of this module was to establish the technical foundation required for future development, including repository creation, environment configuration, and workflow organization. The information presented here is intended to demonstrate a clear understanding of professional development practices and to support academic evaluation.

Purpose

The purpose of Module 1 was to prepare the project for long-term development by creating a structured, reliable, and maintainable environment. This included setting up the GitHub repository, establishing a branching strategy, configuring the local development environment, and organizing tasks through a project board. Completing these steps ensures that the project begins with a stable foundation and follows industry-standard practices throughout the semester.

Work Completed

Several key tasks were completed during Module 1 to establish the project's initial structure:

Repository Setup:

A new GitHub repository was created to store all project files and documentation. The repository includes a .gitignore file appropriate for WordPress development and a clear organizational structure to support future modules.

Branching Structure:

A professional branching model was implemented, including main, dev, and module-1 branches. This structure separates stable code from active development and supports clean version control practices.

Local Development Environment:

The required development environment was configured, including a local server and WordPress installation. This setup allows for testing and development in a controlled environment before deployment.

Project Board Creation:

A GitHub Project Board was created to track tasks for Module 1. Columns for “To Do,” “In Progress,” and “Done” were added, and all relevant tasks were documented to support transparency and organization.

Initial Commit and File Structure:

The initial commit included the base WordPress installation and the foundational file structure for the project. This ensures that future modules begin with a consistent and organized codebase.

Work in Progress

Several tasks are currently in progress as part of Module 1:

Environment Verification:

Testing is underway to confirm that the WordPress installation and local environment function correctly and meet the requirements for future development.

Documentation Development:

Additional documentation is being drafted to support upcoming modules, including notes on workflow, tools, and project expectations.

Module Planning:

Preliminary planning for Module 2 has begun, including identifying required features and preparing the development environment for new functionality.

Next Steps

The following tasks will be completed to finalize Module 1 and prepare for Module 2:

- Complete environment testing to ensure full functionality
- Update the project board to reflect all completed tasks
- Merge the module-1 branch into dev once all requirements are met
- Begin outlining Module 2 objectives and development tasks
- Prepare any additional documentation required for the next module

Conclusion

Module 1 successfully established the foundational structure of the capstone project. The repository, branching model, development environment, and project board were all created and configured according to professional standards. These steps ensure that the project is organized, maintainable, and ready for continued development in Module 2. The work completed in this module demonstrates a clear understanding of technical setup procedures and effective project organization.
