

Lighthouse Evaluation and Performance Review

Opening Statement

The purpose of this document is to explain how Google Lighthouse was used to evaluate the website's performance and to summarize the findings from the initial tests. Lighthouse provides detailed insights into speed, accessibility, best practices, and SEO. Although the tool identified areas where optimization could be applied, no adjustments were made at this stage because performance changes will be completed in the next assignment. This document outlines the results of the Lighthouse evaluation and the planned improvements for future development.

Supporting Paragraph 1: Initial Lighthouse Testing and Findings

Google Lighthouse was used to establish a baseline performance score for both mobile and desktop versions of the website. The initial reports highlighted common opportunities for improvement, such as reducing render-blocking resources, optimizing images, and improving server response times. Metrics including Largest Contentful Paint (LCP), Cumulative Layout Shift (CLS), and Total Blocking Time (TBT) showed that while the site functions correctly, it could benefit from more efficient asset delivery. These findings serve as a guide for the adjustments that will be implemented in the next phase of the project.

Supporting Paragraph 2: No Optimization Applied at This Stage

Although tools such as LiteSpeed Cache, minification settings, and image optimization features were reviewed, no changes were applied during this assignment. The purpose of this phase is to document issues and gather feedback rather than modify the site. Because optimization is part of the next assignment, all settings were left unchanged to preserve the current version of the website. This ensures that future improvements can be clearly demonstrated through before-and-after comparisons.

Supporting Paragraph 3: Planned Adjustments for Next Assignment

In the next assignment, targeted optimizations will be applied based on the Lighthouse findings. These adjustments may include enabling server-level caching, compressing images, minifying CSS and JavaScript, improving layout stability, and integrating a CDN to enhance global performance. After these changes are implemented, Lighthouse will be used again to measure improvements and document the updated performance scores. Screenshots will be captured to show the progression from the initial baseline to the optimized version.

Conclusion

In conclusion, Google Lighthouse was used to evaluate the website's current performance and identify areas for improvement. No optimization was applied during this assignment, as changes will be implemented in the next phase of the project. The initial Lighthouse results provide a clear roadmap for future enhancements, and the upcoming adjustments will focus on improving speed, stability, and overall user experience. The documented findings establish a solid foundation for the optimization work that will follow.
